

MAT 115E Introduction to Programming Language

Lab-11 / CRN : 12850

Instructor: Assoc. Prof. Dr. Soner Aydınlik

Lab Assistant: Res. Asst. Hülya Acar

1 Question 1

As is known, encryption is very old. The most primitive coding technique is done by shifting the letters one in a string to the right. According to this information, write a C program which encrypts each word in the **words.txt** file in ninova by shifting the letters to the right. Then, create the file named **encrypted.txt** and write these encrypted words into this file.

Note: Your program should have a function with the following prototype to encrypt a word.

void encryption(char *s)

For example, if the character string is "Coffee" then the encrypted word must be "Dpggff"

2 Question 2

Write a C program that accomplishes the followings:

A USER-DEFINED FUNCTION:

- It takes a string as a parameter.
- It finds and returns the reverse of the given string.

IN MAIN FUNCTION:

- 1.) Open the file **wordsq2.txt** given in ninova.
- 2.) Read a word from the file.
- 3.) Find the reverse of this word.
- 4.) Write the reversed word to another file that you create **reversed.txt**.
- 5.) Repeat step 2.) until there are no more words left in the file.
